

advanced calculus of one variable

Advanced Calculus of One Variable: Deepening Your Mathematical Journey

advanced calculus of one variable is a fascinating and essential area of mathematics that builds upon the foundational concepts of basic calculus. If you've already mastered limits, derivatives, and integrals, diving into advanced calculus opens up new perspectives and tools that allow you to tackle more complex problems with confidence. Whether you're a student preparing for higher studies or a professional seeking a deeper understanding, exploring this subject enriches your analytical thinking and problem-solving skills.

In this article, we'll explore the core ideas behind advanced calculus of one variable, including rigorous definitions, convergence, series expansions, and the subtle nuances of continuity and differentiability. Along the way, we'll also touch on important related topics such as uniform convergence, Taylor series, and improper integrals, helping you build a well-rounded grasp of the material.

Understanding the Foundations: Beyond Basic Calculus

Advanced calculus of one variable doesn't just revisit the concepts you've learned; it refines them through a more rigorous and formal lens. This means moving from computational techniques to a precise understanding of why those techniques work.

Limits and Continuity: The Rigorous Approach

At the heart of calculus lies the concept of a limit. In advanced calculus, the epsilon-delta definition of limits becomes central. This formalism ensures a precise measurement of how a function behaves near a point. Instead of relying on intuition or graphical interpretations, the epsilon-delta approach demands exactness, which is crucial for proving theorems and understanding continuity at a deeper level.

Continuity, then, is not just about a function having no breaks or jumps; it is about the limit of the function at a point equaling the function's value there. This subtlety is essential when you explore functions that behave strangely or have discontinuities.

Differentiability and Its Nuances

While differentiability might seem straightforward at first glance, advanced calculus dives into the intricate relationship between differentiability and continuity. For example, every differentiable function is continuous, but the converse is not always true. Understanding such details helps avoid common pitfalls.

Moreover, concepts like higher-order derivatives and their interpretations come into play, preparing you for complex applications in physics and engineering. You also encounter the Mean Value Theorem and Rolle's Theorem with rigorous proofs, reinforcing their fundamental roles.

Series and Sequences: The Building Blocks of Advanced Calculus

Sequences and series are pivotal when extending calculus to more advanced topics. They help us approximate functions, solve differential equations, and analyze convergence behavior.

Convergence of Sequences and Series

A sequence is an ordered list of numbers, and understanding whether it converges or diverges is a key skill. Advanced calculus introduces the formal definitions of convergence and explores different types of convergence such as pointwise and uniform convergence.

When dealing with series (the sum of sequence terms), tests like the Comparison Test, Ratio Test, and Root Test become indispensable tools. These allow you to determine whether an infinite series converges, which is fundamental for working with power series and Fourier series later on.

Taylor and Maclaurin Series: Function Approximation

One of the most powerful applications of advanced calculus of one variable is representing complex functions as infinite sums of polynomials. The Taylor series expresses a function as an infinite sum of terms calculated from the function's derivatives at a single point.

This is more than just a mathematical curiosity; Taylor series are widely used in numerical methods, physics, and engineering to approximate functions that are otherwise difficult to handle.

Understanding the radius and interval of convergence of these series is crucial to knowing where these approximations hold true.

Integration Techniques and Improper Integrals

Integration in advanced calculus goes beyond evaluating definite and indefinite integrals. It includes mastering techniques that handle challenging integrals and analyzing integrals that don't converge in the traditional sense.

Advanced Integration Methods

Techniques such as integration by parts, substitution, and partial fractions are foundational. However, advanced calculus also introduces less straightforward methods like contour integration (in complex analysis contexts) and special functions integration.

Mastering these techniques equips you to solve integrals that appear in physics and engineering, such as those involving exponential, logarithmic, and trigonometric functions.

Improper Integrals and Convergence Criteria

Improper integrals occur when the interval of integration is infinite or when the integrand has an infinite discontinuity. Advanced calculus teaches you how to evaluate these integrals by taking limits, and more importantly, how to determine if they converge or diverge.

Understanding convergence tests for improper integrals is essential because these integrals often appear in probability theory, quantum mechanics, and signal processing.

Uniform Convergence and Its Importance

When dealing with sequences of functions, pointwise convergence alone is often insufficient, especially when interchanging limits and integrals or derivatives. This is where uniform convergence becomes significant.

Uniform convergence ensures that the sequence of functions converges at the same rate across the entire domain, preserving continuity and integrability in the limit function. This concept is critical when working with Fourier series, power series, and functional analysis.

Distinguishing Between Pointwise and Uniform Convergence

Pointwise convergence means that for each fixed input, the sequence converges to the function value. However, the speed of convergence can vary with the input point.

In contrast, uniform convergence guarantees a uniform speed of convergence across the domain, enabling the safe exchange of limits and other operations.

Getting comfortable with these ideas strengthens your understanding of function spaces and continuity properties in advanced calculus.

Practical Tips for Mastering Advanced Calculus of One Variable

Tackling advanced calculus can be challenging, but with the right approach, it becomes a rewarding experience. Here are some insights to guide your study:

- **Focus on Understanding Definitions:** Many mistakes stem from a shaky grasp of formal definitions. Spend time internalizing epsilon-delta limits and the precise meaning of continuity and differentiability.
- **Work Through Proofs:** Proofs are not just academic exercises; they reveal why theorems hold and deepen conceptual understanding.
- **Practice a Variety of Problems:** Solving diverse problems, including those involving series convergence and improper integrals, helps build intuition and technical skill.
- **Visualize Functions and Their Behavior:** When possible, graph functions and their approximations to see theoretical ideas in action.
- **Use Supplementary Resources:** Books like Walter Rudin's "Principles of Mathematical Analysis" or Apostol's "Mathematical Analysis" provide excellent coverage for advanced topics.

The Broader Impact of Advanced Calculus of One Variable

While the focus here is on one variable, the concepts you learn set the stage for multivariable calculus, real analysis, and beyond. Applications span numerous fields:

- **Physics:** Modeling motion, waves, and quantum phenomena often requires deep calculus understanding.
- **Engineering:** Signal processing, control systems, and structural analysis rely on precise calculus techniques.
- **Economics:** Optimization problems and dynamic systems use advanced calculus tools.
- **Computer Science:** Algorithms in numerical analysis and machine learning incorporate calculus principles.

By mastering advanced calculus of one variable, you open doors to these exciting areas and develop a mathematical maturity that will serve you well in academic and professional pursuits.

Whether you're reviewing for exams or delving into research, embracing the rigor and beauty of advanced calculus enriches your appreciation for mathematics and its applications in the world around us.

Frequently Asked Questions

What are the key differences between uniform continuity and regular continuity in advanced calculus of one variable?

Uniform continuity requires that the choice of δ in the ϵ - δ definition works uniformly for all points in the domain, whereas regular continuity allows δ to depend on both ϵ and the specific point. Uniform continuity is a stronger condition and is essential in advanced calculus for ensuring function behavior over intervals.

How does the concept of differentiability relate to the continuity of a function in one variable?

In advanced calculus, differentiability of a function at a point implies continuity at that point. However, continuity does not necessarily imply differentiability. A function can be continuous everywhere but differentiable nowhere, such as the Weierstrass function.

What is the significance of Taylor's theorem in advanced calculus of one variable?

Taylor's theorem provides an approximation of a function near a point by a polynomial whose coefficients depend on the function's derivatives at that point. It is significant for analyzing function behavior, error estimation, and solving differential equations.

Can you explain the role of the Mean Value Theorem in the study of functions of one variable?

The Mean Value Theorem (MVT) states that for a continuous function differentiable on an interval, there exists a point where the instantaneous rate of change equals the average rate of change over the interval. MVT is crucial for proving other theorems and understanding function behavior.

What are improper integrals and how are they evaluated

in advanced calculus?

Improper integrals involve integrands or intervals that are unbounded or infinite. They are evaluated as limits of definite integrals over finite intervals. Techniques include comparison tests and limit evaluation to determine convergence or divergence.

How does one apply L'Hôpital's Rule in advanced calculus problems?

L'Hôpital's Rule is used to evaluate limits that result in indeterminate forms like $0/0$ or ∞/∞ by differentiating the numerator and denominator separately and then taking the limit. It simplifies complex limit problems involving one-variable functions.

What is the significance of sequences and series of functions in advanced calculus of one variable?

Sequences and series of functions allow the study of function approximations, convergence properties, and function expansions like power series. Understanding pointwise and uniform convergence is fundamental in analyzing function behavior and continuity.

How are critical points classified using the second derivative test in one-variable calculus?

Critical points occur where the first derivative is zero or undefined. The second derivative test uses the sign of the second derivative at these points to classify them: if positive, the point is a local minimum; if negative, a local maximum; if zero, the test is inconclusive.

What is the role of the Riemann integral in advanced calculus of one variable?

The Riemann integral formalizes the concept of area under a curve for bounded functions on closed intervals. It serves as the foundation for integral calculus, enabling the rigorous evaluation of integrals, and is extended in advanced calculus to more complex functions and convergence analysis.

Additional Resources

Advanced Calculus of One Variable: An In-Depth Exploration

Advanced calculus of one variable is a fundamental area of mathematical analysis that extends the principles of basic calculus to more sophisticated and nuanced realms. It forms the backbone of many theoretical and applied disciplines, including physics, engineering, economics, and beyond. Unlike elementary calculus, which primarily focuses on limits, derivatives, and integrals of single-variable functions at an introductory level, advanced calculus delves into rigorous proofs, complex theorems, and subtle properties of these functions. This article investigates the core concepts, methodologies, and

applications of advanced calculus of one variable, providing a thorough review suitable for students, educators, and professionals aiming to deepen their understanding.

The Scope and Significance of Advanced Calculus of One Variable

Advanced calculus of one variable builds upon the foundational topics covered in introductory calculus courses by incorporating a more formal approach to limits, continuity, differentiation, and integration. It emphasizes precision and logical rigor, often employing epsilon-delta definitions and proofs to establish the validity of various mathematical statements. The subject not only sharpens analytical skills but also lays the groundwork for higher-level mathematical fields such as real analysis and differential equations.

One of the key distinctions in advanced calculus is the treatment of convergence and the behavior of sequences and series of functions. Understanding uniform convergence, pointwise convergence, and their implications is crucial for ensuring the interchangeability of limits and integrals or derivatives, which is a subtle but critical aspect of analysis.

Key Concepts in Advanced Calculus of One Variable

Several core concepts distinguish advanced calculus from its elementary counterpart:

- **Rigorous Limit Definitions:** The epsilon-delta definition of limits provides a precise framework for discussing the behavior of functions as inputs approach specific points.
- **Continuity and Discontinuities:** Advanced calculus explores different types of continuity, including uniform continuity, and classifies discontinuities in greater detail.
- **Differentiation:** Beyond basic derivative rules, it involves the Mean Value Theorem, Taylor's theorem with remainder, and techniques for analyzing the differentiability of more complex functions.
- **Integration:** The Riemann integral is studied thoroughly, including criteria for integrability and the Fundamental Theorem of Calculus in a formal setting.
- **Sequences and Series:** Convergence tests, power series expansions, and the concept of uniform convergence are critical for understanding infinite sums of functions.

Analytical Tools and Theorems in Advanced Calculus

The power of advanced calculus lies in its rich collection of theorems and analytical tools that provide insight into function behavior and problem-solving strategies.

Mean Value Theorem and Its Variants

The Mean Value Theorem (MVT) is a cornerstone of advanced calculus. It guarantees the existence of a point where the instantaneous rate of change (derivative) matches the average rate of change over an interval. Its generalizations, such as Cauchy's Mean Value Theorem, serve as foundational tools in proving inequalities, monotonicity, and the behavior of differential functions.

Taylor's Theorem and Series Expansion

Taylor's theorem, with its remainder term, offers a powerful method for approximating functions using polynomials. This theorem is critical for error estimation and provides a bridge between calculus and numerical methods. The study of convergence of Taylor series in advanced calculus addresses whether such polynomial approximations accurately represent the original function within given intervals.

Integration Techniques and Theorems

Advanced calculus revisits the Riemann integral with a focus on its formal definition and properties. It also explores improper integrals and conditions under which integrals converge. The Fundamental Theorem of Calculus is rigorously proved, linking differentiation and integration in a seamless framework. Moreover, techniques such as integration by parts and substitution are analyzed in the context of their theoretical underpinnings.

Challenges and Advantages of Studying Advanced Calculus of One Variable

Studying advanced calculus presents both intellectual challenges and significant benefits. Its rigorous nature demands a strong foundation in logic and proof strategies, which can be daunting for many learners.

Challenges

- **Abstract Reasoning:** Moving from computational calculus to proof-based reasoning requires a shift in mindset that can be difficult.
- **Complex Definitions:** The formal definitions of limits, continuity, and integrals are more complex and less intuitive than their elementary versions.
- **Technical Rigor:** Proofs often involve intricate epsilon-delta arguments and subtle logical nuances.

Advantages

- **Enhanced Mathematical Maturity:** Mastery of advanced calculus equips students with skills essential for higher mathematics and theoretical research.
- **Broader Applicability:** A deep understanding of calculus concepts enables their application in diverse scientific and engineering problems.
- **Preparation for Advanced Topics:** It serves as a stepping stone to real analysis, complex analysis, and differential equations.

Applications and Practical Relevance

While the theoretical aspects of advanced calculus of one variable are profound, its applications span numerous fields. In physics, calculus is used to analyze motion, forces, and energy. Engineering disciplines employ calculus for system modeling, control theory, and signal processing. Economics relies on calculus for optimization problems, marginal analysis, and modeling economic behaviors.

The rigorous treatment of functions and convergence in advanced calculus ensures that the mathematical models used in these fields are robust and reliable. For instance, in numerical methods, understanding the convergence of series and functions is essential for algorithm accuracy and stability.

Comparative Perspective: Elementary vs. Advanced Calculus

Elementary calculus introduces learners to the fundamental operations of differentiation and integration with a focus on computational techniques. In contrast, advanced calculus dives into the theoretical foundations, emphasizing proofs and a formal understanding of concepts. While elementary calculus is sufficient for many practical problems, advanced calculus prepares students for research and complex problem-solving by fostering a deeper comprehension of the underlying mathematics.

- **Elementary Calculus:** Focuses on procedural skills, applications, and basic problem-solving.
- **Advanced Calculus:** Centers on theoretical rigor, logical structure, and abstract reasoning.

The transition from elementary to advanced calculus is often marked by an increased use of precise language and the necessity to justify every step through logical argumentation, which is crucial for ensuring mathematical validity.

As mathematical education evolves, the role of advanced calculus of one variable remains integral in cultivating analytical proficiency and a profound grasp of continuous phenomena. Its thorough approach not only enriches the learner's mathematical toolkit but also enhances the capacity to tackle complex challenges across scientific disciplines.

advanced calculus of one variable: The Advanced Calculus of One Variable Don R. Lick, 1971
advanced calculus of one variable: *Advanced Calculus of a Single Variable* Tunc Geveci, 2016-03-30 This advanced undergraduate textbook is based on a one-semester course on single variable calculus that the author has been teaching at San Diego State University for many years. The aim of this classroom-tested book is to deliver a rigorous discussion of the concepts and theorems that are dealt with informally in the first two semesters of a beginning calculus course. As such, students are expected to gain a deeper understanding of the fundamental concepts of calculus, such as limits (with an emphasis on ϵ - δ definitions), continuity (including an appreciation of the difference between mere pointwise and uniform continuity), the derivative (with rigorous proofs of various versions of L'Hôpital's rule) and the Riemann integral (discussing improper integrals in-depth, including the comparison and Dirichlet tests). Success in this course is expected to prepare students for more advanced courses in real and complex analysis and this book will help to accomplish this. The first semester of advanced calculus can be followed by a rigorous course in multivariable calculus and an introductory real analysis course that treats the Lebesgue integral and

metric spaces, with special emphasis on Banach and Hilbert spaces.

advanced calculus of one variable: Advanced Calculus (Revised Edition) Lynn Harold Loomis, Shlomo Zvi Sternberg, 2014-02-26 An authorised reissue of the long out of print classic textbook, *Advanced Calculus* by the late Dr Lynn Loomis and Dr Shlomo Sternberg both of Harvard University has been a revered but hard to find textbook for the advanced calculus course for decades. This book is based on an honors course in advanced calculus that the authors gave in the 1960's. The foundational material, presented in the unstarred sections of Chapters 1 through 11, was normally covered, but different applications of this basic material were stressed from year to year, and the book therefore contains more material than was covered in any one year. It can accordingly be used (with omissions) as a text for a year's course in advanced calculus, or as a text for a three-semester introduction to analysis. The prerequisites are a good grounding in the calculus of one variable from a mathematically rigorous point of view, together with some acquaintance with linear algebra. The reader should be familiar with limit and continuity type arguments and have a certain amount of mathematical sophistication. As possible introductory texts, we mention *Differential and Integral Calculus* by R Courant, *Calculus* by T Apostol, *Calculus* by M Spivak, and *Pure Mathematics* by G Hardy. The reader should also have some experience with partial derivatives. In overall plan the book divides roughly into a first half which develops the calculus (principally the differential calculus) in the setting of normed vector spaces, and a second half which deals with the calculus of differentiable manifolds.

advanced calculus of one variable: Advanced Calculus of Several Variables Charles Henry Edwards, 1994-01-01 Modern conceptual treatment of multivariable calculus, emphasizing the interplay of geometry and analysis via linear algebra and the approximation of nonlinear mappings by linear ones. At the same time, ample attention is paid to the classical applications and computational methods. Hundreds of examples, problems and figures. 1973 edition.

advanced calculus of one variable: Advanced Calculus Avner Friedman, 2007-03-15 Intended for students who have already completed a one-year course in elementary calculus, this two-part treatment advances from functions of one variable to those of several variables. Solutions. 1971 edition.

advanced calculus of one variable: Introduction to Analysis in Several Variables: Advanced Calculus Michael E. Taylor, 2020-07-27 This text was produced for the second part of a two-part sequence on advanced calculus, whose aim is to provide a firm logical foundation for analysis. The first part treats analysis in one variable, and the text at hand treats analysis in several variables. After a review of topics from one-variable analysis and linear algebra, the text treats in succession multivariable differential calculus, including systems of differential equations, and multivariable integral calculus. It builds on this to develop calculus on surfaces in Euclidean space and also on manifolds. It introduces differential forms and establishes a general Stokes formula. It describes various applications of Stokes formula, from harmonic functions to degree theory. The text then studies the differential geometry of surfaces, including geodesics and curvature, and makes contact with degree theory, via the Gauss-Bonnet theorem. The text also takes up Fourier analysis, and bridges this with results on surfaces, via Fourier analysis on spheres and on compact matrix groups.

advanced calculus of one variable: Thermodynamics of Small Systems Terrell L. Hill, 1994-01-01 Authoritative summary introduces basics, explores environmental variables, examines binding on macromolecules and aggregation, and includes brief summaries of electric and magnetic fields, spherical drops and bubbles, and polydisperse systems. 1963 and 1964 editions.

advanced calculus of one variable: X-Ray Diffraction A. Guinier, 2013-01-17 Exploration of fundamentals of x-ray diffraction theory using Fourier transforms applies general results to various atomic structures, amorphous bodies, crystals, and imperfect crystals. 154 illustrations. 1963 edition.

advanced calculus of one variable: Introduction to Modern Algebra and Matrix Theory O. Schreier, E. Sperner, 2013-05-13 This unique text provides students with a basic course in both calculus and analytic geometry. It promotes an intuitive approach to calculus and emphasizes

algebraic concepts. Minimal prerequisites. Numerous exercises. 1951 edition.

advanced calculus of one variable: Vector and Tensor Analysis Louis Brand, 2020-04-15 An outstanding introduction to tensor analysis for physics and engineering students, this text admirably covers the expected topics in a careful step-by-step manor. In addition to the standard vector analysis of Gibbs, including dyadic or tensors of valence two, the treatment also supplies an introduction to the algebra of motors. The entire theory is illustrated by many significant applications. Surface geometry and hydrodynamics are treated at length in separate chapters. Nearly all of the important results are formulated as theorems, in which the essential conditions are explicitly stated. Each chapter concludes with a selection of problems that develop students' technical skills and introduce new and important applications. The material may be adapted for short courses in either vector analysis or tensor analysis.

advanced calculus of one variable: Almost Periodic Functions Harald Bohr, 2018-08-15 Starting with a discussion of periodic functions, this groundbreaking exposition advances to the almost periodic case. An appendix covers the almost periodic functions of a complex variable. 1947 edition.

advanced calculus of one variable: The Theory of Lie Derivatives and Its Applications Kentaro Yano, 2020-05-21 Differential geometry has become one of the most active areas of math publishing, yet a small list of older, unofficial classics continues to interest the contemporary generation of mathematicians and students. This advanced treatment of topics in differential geometry, first published in 1957, was praised as well written by The American Mathematical Monthly and hailed as undoubtedly a valuable addition to the literature. Its topics include: • Spaces with a non-vanishing curvature tensor that admit a group of automorphisms of the maximum order • Groups of transformations in generalized spaces • The study of global properties of the groups of motions in a compact orientable Riemannian space • Lie derivatives in an almost complex space For advanced undergraduates and graduate students in mathematics

advanced calculus of one variable: Pearls in Graph Theory Nora Hartsfield, Gerhard Ringel, 2013-04-15 Stimulating and accessible, this undergraduate-level text covers basic graph theory, colorings of graphs, circuits and cycles, labeling graphs, drawings of graphs, measurements of closeness to planarity, graphs on surfaces, and applications and algorithms. 1994 edition.

advanced calculus of one variable: Fractional Graph Theory Edward R. Scheinerman, Daniel H. Ullman, 2013-04-29 This volume explains the general theory of hypergraphs and presents in-depth coverage of fundamental and advanced topics: fractional matching, fractional coloring, fractional edge coloring, fractional arboricity via matroid methods, fractional isomorphism, and more. 1997 edition.

advanced calculus of one variable: Principles of Electrodynamics Melvin Schwartz, 2012-04-24 The 1988 Nobel Prize winner establishes the subject's mathematical background, reviews the principles of electrostatics, then introduces Einstein's special theory of relativity and applies it to topics throughout the book.

advanced calculus of one variable: Commutative Algebra, Volume II Oscar Zariski, Pierre Samuel, 2019-11-13 The second text in this two-book series extends the classical material of Volume I, which focuses on field theory and the ideal theory of Noetherian rings and Dedekind domains. The connection of Volume II's material to algebraic geometry is stressed throughout the presentation, making this book a practical introduction to some basic concepts and the arithmetical foundations of algebraic geometry. The opening chapter deals with properties of places and is followed by a chapter that explores the classical properties of polynomial and power series rings and their applications to algebraic geometry. The final chapter examines the theory of local rings, which provides the algebraic basis for the local study of algebraic and analytical varieties. Several helpful Appendixes conclude the text.

advanced calculus of one variable: How to Gamble If You Must Lester E. Dubins, Leonard J. Savage, William Sudderth, David Gilat, 2014-08-20 This classic of advanced statistics is geared toward graduate-level readers and uses the concepts of gambling to develop important ideas in

probability theory. The authors have distilled the essence of many years' research into a dozen concise chapters. Strongly recommended by the Journal of the American Statistical Association upon its initial publication, this revised and updated edition features contributions from two well-known statisticians that include a new Preface, updated references, and findings from recent research. Following an introductory chapter, the book formulates the gambler's problem and discusses gambling strategies. Succeeding chapters explore the properties associated with casinos and certain measures of subfairness. Concluding chapters relate the scope of the gambler's problems to more general mathematical ideas, including dynamic programming, Bayesian statistics, and stochastic processes. Dover (2014) revised and updated republication of the 1976 Dover edition entitled *Inequalities for Stochastic Processes*. See every Dover book in print at www.doverpublications.com

advanced calculus of one variable: *Algebraic Extensions of Fields* Paul J. McCarthy, 1991-04-01 Graduate-level coverage of Galois theory, especially development of infinite Galois theory; theory of valuations, prolongation of rank-one valuations, more. Over 200 exercises. Bibliography. ...clear, unsophisticated and direct... — Math.

advanced calculus of one variable: Numerical Methods for Two-Point Boundary-Value Problems Herbert B. Keller, 2018-11-14 Elementary yet rigorous, this concise treatment explores practical numerical methods for solving very general two-point boundary-value problems. The approach is directed toward students with a knowledge of advanced calculus and basic numerical analysis as well as some background in ordinary differential equations and linear algebra. After an introductory chapter that covers some of the basic prerequisites, the text studies three techniques in detail: initial value or shooting methods, finite difference methods, and integral equations methods. Sturm-Liouville eigenvalue problems are treated with all three techniques, and shooting is applied to generalized or nonlinear eigenvalue problems. Several other areas of numerical analysis are introduced throughout the study. The treatment concludes with more than 100 problems that augment and clarify the text, and several research papers appear in the Appendixes.

advanced calculus of one variable: Mathematical Economics Kelvin Lancaster, 2012-10-10 Graduate-level text provides complete and rigorous expositions of economic models analyzed primarily from the point of view of their mathematical properties, followed by relevant mathematical reviews. Part I covers optimizing theory; Parts II and III survey static and dynamic economic models; and Part IV contains the mathematical reviews, which range from linear algebra to point-to-set mappings.
